

Jupiter

The giant red planet has bright colors and complex patterns that scientists had never seen through their telescopes. It is covered with wide bands of yellow, orange, red and white clouds. Violent storms move through the clouds.

Saturn

Saturn is the second largest planet in the solar system only Jupiter is bigger. But although Saturn is big, it is very light. It is not like a big rock. A rock would sink in a bucket of water. If you could find a bucket big enough, Saturn would float in it.
